Opis produktu

RacingLine's stunning carbon Cold-Air Intake System kit for the Audi RS3 8V.2 and TTRS (DAZA and DWNA engines) enables cold, dense air from outside the engine bay to reach the fuel metering unit more efficiently for great power gains, particularly on tuned cars. (Currently Right Hand Drive cars only) Welcome to RacingLine's highest-performing, race-bred carbon fibre cold-air (induction) intake for the Audi RS3 8V FL & TTRS 8S. Currently for right-hand drive models only. The intake uses stunning matte 3K twill carbon fibre for front scoop, intake canister and 3.5" rear intake pipe for ultra-light weight and improved thermal insulation to keep IATs down. Lots of cold, fresh air is collected via the full-width single-piece intake scoop, with CFD-developed internal ducting to feed the huge filter surface area, with minimal turbulence. This combines with the enlarged carbon 90mm (3.5") diameter rear intake pipe. RacingLine's giant High-Flow TriFoam™ triple-layer construction is simply the most efficient filtration material on the market, and is the key to the power gains achieved. Each filter is handmade in the UK, with a surface area 42.5% larger than the factory filter at 95,717mm². You'll hear the rich induction noise from this race-bred intake as soon as you accelerate hard. However, as a fully-enclosed intake, volume levels are well-contained. It's not just about performance; the stunning carbon weave of the intake will enhance your engine bay every time you lift the hood.
